PRACTICE LAB ASSIGNMENT 6

1. Define a function called hypotenuse that calculates the length of the hypotenuse of a right triangle when the other two sides are given. The function should take two arguments of type double and return the hypotenuse as a double.

CODE

```
#include <stdio.h>
#include <math.h>
double hypotenuse(double, double);
double main()
double A, B;
printf("\nEnter two values for the two sides of a right-angled traingle to find its
HYPOTENUSE");
                                                  double hypotenuse(double, double);
double main()
                                                         double A, B;
printf("\nEnter two values for the two sides of a right-angled traingle to find its HYPOTENUSE");
printf("\nEnter A: ");
scanf("%lf", &A);
printf("\nEnter B: ");
scanf("%lf", &B);
printf("\nThe HYPOTENUSE is %lf", hypotenuse(A, B));
printf("\nEnter A: ");
scanf("%lf", &A);
                                                  double hypotenuse(double A, double B)
printf("\nEnter B: ");
                                                         double n, C;
C = sqrt((A * A) + (B * B));
return C;
scanf("%lf", &B);
printf("\nThe HYPOTENUSE is %lf", hypotenuse(A, B));
double hypotenuse(double A, double B)
double n, C;
C = sqrt((A * A) + (B * B));
return C;
                                     student@HP-280-G3-MT:~$ pwd
                                     /home/student
                                    student@HP-280-G3-MT:~$ cd Desktop
student@HP-280-G3-MT:~/Desktop$ ls
a.out me q1.c Untitled Folder
student@HP-280-G3-MT:~/Desktop$ gcc q1.c -lm
student@HP-280-G3-MT:~/Desktop$ ./a.out
SS of the OUTPUT
                                    Enter two values for the two sides of a right-angled traingle to find its HYPOTE
                                    Enter A: 3
```

The HYPOTENUSE is 5.000000student@HP-280-G3-MT:~/Desktop\$

Enter B: 4

2. An integer number is said to be a perfect number if its factors, including 1 (but not the number itself), sum to the number. For example, 6 is a perfect number because 6 = 1 + 2 + 3. Write a function perfect () that determines if parameter number is a perfect number. Use this function in a program that determines and prints all the perfect numbers between 1 and 1000. Print the factors of each perfect number to confirm that the number is indeed perfect.

```
#include <stdio.h>
int perfect(int);
int main()
{
  int n;
  printf("\nThe list of perfect numbers between 1 and 1000 are:");
  perfect(n);
  return 0;
int perfect(int n)
  int i, sum;
  for(n = 1; n \le 1000; n++)
  {
    sum = 0;
    for(i = 1; i < n; i++)
       if(n\%i == 0)
         sum += i;
       }
```

```
ROLL NO.: 2210110505
```

```
if(sum == n)
  printf("\n%d is a PERFECT number", n);
  printf("\nIt's factors are: ");
    for(i = 1; i < n; i++)
       if(n\%i == 0)
         printf("%d ", i);
    printf("\n");
```

SS of the OUTPUT

ROLL NO.: 2210110505

3. Write a program using function that takes an integer value and returns the number with its digits reversed. For example, given the number 7631, the function should return 1367.

```
#include <stdio.h>
int reverse(int);
int main()
  int n;
  printf("\nEnter any integer to find out its reverse: ");
  scanf("%d", &n);
  printf("The reverse of the entered integer value is %d", reverse(n));
                                       int reverse(int);
                                       int main()
int reverse(int n)
                                           int n;
                                                ("\nEnter any integer to find out its reverse: ");
                                               ("%d", &n);

f("The reverse of the entered integer value is %d", reverse(n));
  int rev = 0, r;
                                       int reverse(int n)
                                           int rev = 0, r;
  if(n == 0)
                                           if(n == 0)
return 0;
  return 0;
  while(n = 0)
                                               rev = ((rev * 10) + r);
                                              n /= 10;
                                           return rev;
                                                                                                 input
     r = n\%10;
                                 Enter any integer to find out its reverse: 0
                                 The reverse of the entered integer value is 0
     rev = ((rev * 10) + r);
                                  ..Program finished with exit code 0
                                 Press ENTER to exit console.
     n = 10;
                              Enter any integer to find out its reverse: 1367
                              The reverse of the entered integer value is 7631
                               ..Program finished with exit code 0
  return rev;
                              Press ENTER to exit console.
                             Enter any integer to find out its reverse: -3671
                             The reverse of the entered integer value is -1763
SS of the OUTPUT
                              ..Program finished with exit code 0
                              Press ENTER to exit console.
```

ROLL NO.: 2210110505

4. Write a Program to print the Fibonacci Series with the help of functions. A Fibonacci Series is a series of numbers where the next number in the series is equal to the sum of previous 2 numbers. Example:-A Fibonacci series of 8 terms will be -0, 1, 1, 2, 3, 5, 8, 13.

```
#include<stdio.h>
int fibonacci(int, int, int, int);
int main()
  int t, a = 0, b = 1, n = a + b;
  printf("\nEnter the number of terms of the Fibonacci series you need: ");
  scanf("%d", &t);
  printf("A Fibonacci series of %d terms will be: 0, 1, ", t);
  fibonacci(t, a, b, n);
  return 0;
int fibonacci(int t, int a, int b, int n)
                                           int fibonacci(int, int, int, int);
  int i;
                                          int main()
                                               int t, a = 0, b = 1, n = a + b;
  for(i = 1; i \le (t - 2); i++)
                                                    ("\nEnter the number of terms of the Fibonacci series you need: ");
("%d", &t);
("A Fibonacci series of %d terms will be: 0, 1, ", t);
                                               fibonacci(t, a, b, n);
                                           }
int fibonacci(int t, int a, int b, int n)
         printf("%d, ", n);
                                               int i;
         a = b;
                                               for(i = 1; i \leftarrow (t - 2); i++)
                                                       printf("%d, ", n);
         b = n;
                                                       a = b;
b = n;
                                                         = a + b;
         n = a + b;
                                     Enter the number of terms of the Fibonacci series you need: 8
                                     A Fibonacci series of 8 terms will be: 0, 1, 1, 2, 3, 5, 8, 13,
                                       ..Program finished with exit code 0
                                      ress ENTER to exit console.
SS of the OUTPUT
```

ROLL NO.: 2210110505

5. Write a function multiple that determines for a pair of integers whether the second integer is a multiple of the first. The function should take two integer arguments and return 1(true) if the second is a multiple of the first and 0 (false) otherwise.

```
#include<stdio.h>
int multiple(int, int);
int main()
  int n, m;
  printf("\nEnter any integer: ");
  scanf("%d", &n);
  printf("\nEnter an integer to check if it's a multiple of the previous number: ");
  scanf("%d", &m);
  printf("%d", multiple(n, m));
  return 0;
                                     int multiple(int, int);
                                     int main()
                                         int n, m;
                                               ("\nEnter any integer: ");
("%d", &n);
int multiple(int n, int m)
                                               ("\nEnter an integer to check if it's a multiple of the previous number: ");
                                         scanf("%d", &m);
printf("%d", multiple(n, m));
return 0;
  if(m%n == 0)
                                     int multiple(int n, int m)
                                         if(m%n == 0)
return 1;
  return 1;
  else
                                                                                    input
  return 0;
                                Enter any integer: 7
                                Enter an integer to check if it's a multiple of the previous number: 48
                                  .Program finished with exit code 0
SS of the OUTPUT
                                  ess ENTER to exit console.
Enter any integer: 7
Enter an integer to check if it's a multiple of the previous number: 49
 ...Program finished with exit code 0
Press ENTER to exit console.
```
